

FC1: System Design Issues

Failures originating from system design decisions, prompt specifications, or state management.

LEP	Definition
1.1 Disobey Task Specification	Agent/system fails to follow the intended task requirements.
1.2 Disobey Role Specification	Agent violates its assigned role or responsibilities.
1.3 Step Repetition	Execution unnecessarily repeats previous steps or loops.
1.4 Loss of Conversation History	Relevant context or state is forgotten during execution.
1.5 Unaware of Termination Conditions	System fails to recognize when the task has been completed.

FC2: Inter-Agent Misalignment

Failures arising from breakdowns in information flow and coordination between agents.

LEP	Definition
2.1 Conversation Reset	Agent unexpectedly resets or loses the ongoing conversation.
2.2 Fail to Ask for Clarification	Agent proceeds with incorrect assumptions instead of requesting missing information.
2.3 Task Derailment	Conversation or execution deviates from the original objective.
2.4 Information Withholding	Agent fails to communicate crucial information needed by another agent.
2.5 Ignored Other Agent's Input	Agent disregards relevant information provided by another agent.
2.6 Reasoning-Action Mismatch	Agent's executed action does not align with its own reasoning process.

FC3: Task Verification

Failures involving inadequate verification or quality control.

LEP	Definition
3.1 Premature Termination	Task ends before it is actually complete.
3.2 No or Incomplete Verification	Output is not verified or verification is insufficient.
3.3 Incorrect Verification	Verification process exists but incorrectly approves an erroneous output.

Node LEPs: Disobey Role Specification, Step Repetition, Reasoning-Action Mismatch, Premature Termination, Incorrect Verification.

Edge LEPs: Information Withholding, Ignored Other Agent's Input, Conversation Reset, Fail to Ask for Clarification.

State/Memory LEPs: Loss of Conversation History, Task Derailment, Unaware of Termination Conditions.
